

BIO-CLEAN

ADVANCED CARPET EXTRACTION CLEANER AND ODOR ELIMINATOR

Benefits

- Designed specifically for extraction cleaning of carpet and upholstery
- Cleans effectively without encouraging resoiling
- Provides fresher, cleaner carpet and fabric for a more pleasant room environment
- Maintains longer-lasting odor control by eliminating the source of organic fouling

BIO-CLEAN combines new cleaning technology with promicrobial action to enhance cleaning efficacy and provide long-lasting odor control. This advanced formulation provides superior cleaning performance with the comfort and safety of green technology. **BIO-CLEAN** is designed for carpet extraction and can be used on most fabric surfaces including upholstery, draperies, and car seats.

Carpet stains and soils are made up of particulates that are often bound to carpet by oily residues. Carpet cleaning with conventional chemical products may leave embedded soils behind resulting in a dull or dirty appearance and high-traffic areas often still appear soiled. Common stains, spills and pet accidents leave organic deposits and odors in carpets and fabric that can reappear after normal cleaning.

As clean carpet is left to dry, subsurface soils can gradually wick up into the carpet fibers making the carpet appear dirtier than when it was initially cleaned. Mold, encouraged by moist environments, can grow on residual organics in the carpet pile, backing and pad, giving a musty odor. Stained, musty carpet gives the impression of a generally unclean environment creating a negative experience for family and visitors. Allergic responses are often associated with mold growth in carpet.

BIO-CLEAN provides dual cleaning power to remove most embedded soils and organics with a single application. First the novel surfactant system quickly releases soil into the cleaning solution so it can be readily extracted. In addition to the initial cleaning action, microbes penetrate deep into the carpet pile, backing, pad, and sub surfaces where they are activated by residual organics. These unique microbes have the ability to breakdown a wide range of organic soils making the area cleaner and less prone to mold and mildew. Microbes continue to clean the carpet as long as the organics and moisture remains.
